

PROJECT STATUS OVERVIEW

We have successfully completed all core Day 1, 2, and 3 deliverables for the platform foundations. The codebase is highly integrated and prepared for scaling.

	Llama Router
	Gemini Research
	Gemini Action
	Claude Validator
	Supabase RAG
	Mem0 Profile
	Sandbox API
	Skyvern Agent
	Email Dispatcher
	WhatsApp Bot
	Voice Call API
	Langfuse Tracing

CORE CODE STRENGTHENING

Before starting custom implementations on the hackathon day, the team needs to work together to harden the base template:

☐ **Implement Mock Mode**

Create fake mock response logic inside tools so you can run end-to-end tests completely for free.

☐ **Dockerize the stack**

Create a root docker-compose file to spin up Next.js, Express, and Database with one click.

☐ **Optimize Search Fallbacks**

Set up automated local fallback flows if external LLMs or search indexers hit query limits.

ASSIGNED TEAMMATE CHECKLISTS

To make sure the project remains modular and clean, each person must perform their work exclusively in their assigned branch.

 Person A — Orchestrator Lead

feat/orchestrator

☐ **Dockerize the Workspace**

Write the Dockerfile and docker-compose.yml to run services locally.

☐ **Centralize Agent Persona Configurations**

Extract prompt templates from javascript logic into a single json config for quick editing.

☐ **Adjustable Validator Threshold**

Add front-end control sliders to tweak Claude Validator strictness on the fly.

 Person B — Tools Lead

feat/tools

☐ **Create Local Mock Providers**

Implement offline mock behavior inside tools/ folder for SMS, calls, and scraper.

☐ **Skyvern Result Webhooks/Polling**

Update the Skyvern execution tool to fetch final page logs upon form automation completions.

☐ **Prevent Multi-execution Loops**

Add rate limit bounds to action triggers so agents don't call tools infinitely.

 Person C — Memory Lead

feat/memory

☐ **Semantic Batch Ingestion Script**

Build a helper script to automatically slice and vector-index local files into pgvector.

☐ **Pgvector RRF Hybrid Search**

Implement Reciprocal Rank Fusion to merge semantic search scores with exact string lookups.

☐ **Session Clearing Endpoint**

Expose a DELETE route to wipe memory vectors to start fresh benchmarking sessions.
